

# TITAN N

ANGOLARE PER FORZE DI TAGLIO E DI TRAZIONE  
ANGLE BRACKET FOR SHEAR AND TENSILE FORCES

Resistenze a taglio eccezionali  
Exceptional shear resistance

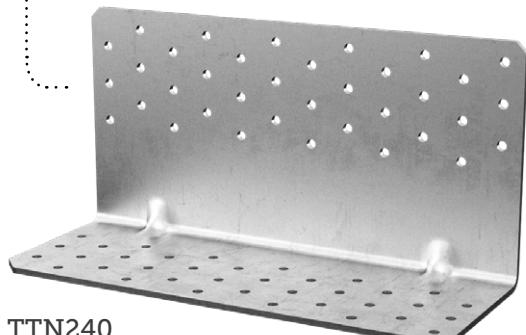

TCN200

Ottime resistenze a trazione  
Excellent tensile strength

TCW200

Ottime resistenze sia a taglio che a trazione  
Excellent shear and tensile strength

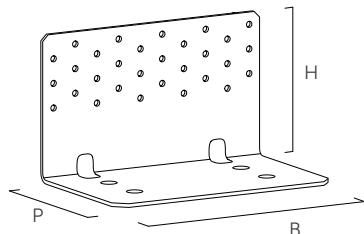

TTN240

MATERIALE / MATERIAL

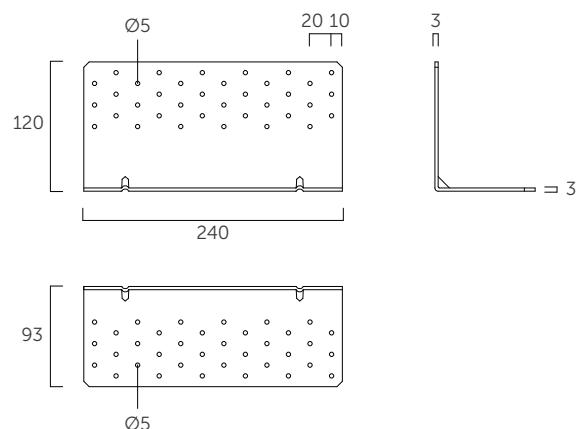

TITAN N

Acciaio al carbonio DX51D con zincatura Z275.  
Z275 bright zinc plated DX51D carbon steel.

TITAN WASHER

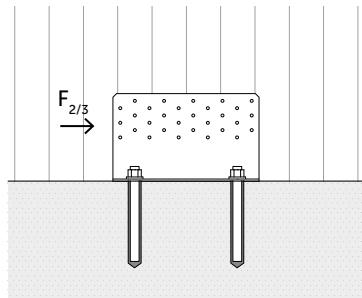

Acciaio al carbonio S235 con zincatura galvanica.  
S235 bright zinc plated carbon steel.

### NOTE NOTES

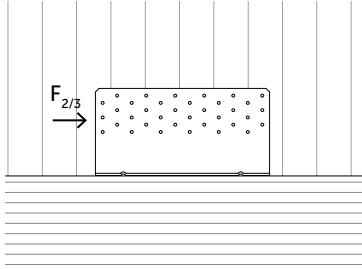

<sup>(1)</sup> Installazione degli ancoranti nei due fori interni (IN) in assenza di distanze dal bordo in calcestruzzo.  
Installation of the anchors in the two internal holes (IN) in concrete, where edge-distance is not a limiting factor.

<sup>(2)</sup> Installazione degli ancoranti nei due fori esterni (OUT) in assenza di distanze dal bordo in calcestruzzo.  
Installation of the anchors in the two external holes (OUT) in concrete, where edge-distance is not a limiting factor.

<sup>(3)</sup> In caso di ancoranti alternativi, il gruppo deve essere verificato per  $R_{1,d} \geq 2k_{v//} \times F_{1,d} = 2 \times 1,09 \times F_{1,d}$ .  
For alternative anchors, the group must be verified for  $R_{1,d} \geq 2k_{v//} \times F_{1,d} = 2 \times 1,09 \times F_{1,d}$ .

### PRINCIPI GENERALI GENERAL PRINCIPLES

- I valori caratteristici degli angolari TITAN sono secondo normativa EN 1995-1-1 in accordo a ETA-11/0496. I valori di progetto degli ancoranti per calcestruzzo sono calcolati in accordo alle rispettive Valutazioni Tecniche Europee.  
*The characteristic values of the TITAN angle brackets comply with the EN 1995-1-1 standard in accordance with ETA-11/0496. The design values of the anchors for concrete are calculated in accordance with the respective European Technical Assessments.*
- I valori di resistenza di progetto si ricavano dai valori tabellati come segue:  
*Design resistance values can be obtained from the tabled values as follows:*

$$R_d = \min \left\{ \frac{R_{k,timber} \cdot k_{mod}}{\gamma_M}, R_{d,concrete} \right\}$$

I coefficienti  $k_{mod}$  e  $\gamma_M$  sono da assumersi in funzione della normativa vigente utilizzata per il calcolo.  
*Coefficients  $k_{mod}$  and  $\gamma_M$  must be taken according to the current Standard adopted for the design.*

- In fase di calcolo si è considerata una massa volumica degli elementi lignei pari a  $\rho_k = 350 \text{ kg/m}^3$  e calcestruzzo C20/25 con armatura rada e spessore minimo pari a 200 mm.  
*The calculation process used a timber characteristic density of  $\rho_k = 350 \text{ kg/m}^3$  and C20/25 concrete with a thin reinforcing layer and minimum thickness of 200 mm.*
- Il dimensionamento e la verifica degli elementi in legno e calcestruzzo devono essere svolti a parte.  
*Dimensioning and verification of timber and concrete elements must be carried out separately.*
